

### How to manage Awstats with specific domains

Hi

**Awstats** runs for 14 hours on my server and I need a solution to manage **awstats** to run only with only some domains.

I resolve this problem with the best support from DirectAdmin Staff.

I hope this will be usefull for the other DirectAdmin Users. Do as follows:

- Create a file with "vi /home/admin/scripts/awstats.list" use admin so that it will be store in your backup for future usage.
- Enter all domains you want to create stats. For example:  
domain1.com  
domain2.com  
domain3.com  
Save it when you finished.
- vi /usr/local/directadmin/scripts/awstats\_process.sh
- Add this lines under DOMAIN=\$2

```
PRESENT=`grep -c -e "^$DOMAIN\$" /home/admin/scripts/awstats.list`  
if [ "$PRESENT" -eq 0 ]; then  
echo "not running awstats for $DOMAIN";  
exit 0;  
fi
```

- Save it.

Now, when the cron run **awstats** it will work only with your selected domains as expected.

You can see the result after the next **awstats** runs next time.
